

Pandas + Matplotlib

Pandas \Rightarrow notebook explaining lots of fun
+
historic data example

Numpy \Rightarrow 1 assignment + notebook which helps
you in understanding
it

Matplotlib \Rightarrow Lib explaining a lot of stuff.

Pandas \Rightarrow

3 hours
 \Downarrow 10x
30 hours

english $\begin{cases} \rightarrow$ practice
 \rightarrow Read / other people speaking

practice \Rightarrow dataset

\Rightarrow see other people code.

Methods in Pandas

append()

apply()

count()

describe()

head()

transpose()

drop_duplicates()

sum()

in-place
in jupyter

If result for some action on inbuilt method

is shown, no changes to original df

else if not shown, changes are done
in df.

Pandas Series

Series \Rightarrow 1D homogenous size is fixed

10	20	30	40	50	60
----	----	----	----	----	----

 Series

Each column in a df is actually a Series

`pd.Series (data , index)`

Series is One Dimensional array to hold different types of values.

pandas.Series (data, index, dtype, copy)

- data: It can be any list, dictionary, or scalar value.
- index: The value of the index should be unique and hashable. It must be of the same length as data. If we do not pass any index, default `np.arange(n)` will be used.
- dtype: It refers to the data type of series.
- copy: It is used for copying the data.

Matplotlib

Plotting Library

"A picture is worth a thousand words"

numpy
Pandas }

300%

⇒ matplotlib is a visualization library in python
for 2-D plots

⇒ built on top of numpy

→ lots of graphs/plots line, bar, histogram
