Data Types in NumPy

NumPy has some extra data types, and refer to data types with one character, like **i** for integers, **u** for unsigned integers etc.

Below is a list of all data types in NumPy and the characters used to represent them.

- **i** - integer
- **b** - boolean
- **u** - unsigned integer 
- **f** - float
- **c** - complex float
- **m** - timedelta
- **M** - datetime
- **O** - object
- **S** - string
- **U** - unicode string
- **V** - fixed chunk of memory for other type (void)

Because, we are making our numpy
array using numpy fⁿ.

the type is also taken as that
of numpy.int64

Table 4-2. NumPy data types

| Type | Type Code | Description |
|-------------------|-----------|--|
| int8, uint8 | i1, u1 | Signed and unsigned 8-bit (1 byte) integer types |
| int16, uint16 | i2, u2 | Signed and unsigned 16-bit integer types |
| int32, uint32 | i4, u4 | Signed and unsigned 32-bit integer types |
| int64, uint64 | i8, u8 | Signed and unsigned 32-bit integer types |
| float16 | f2 | Half-precision floating point |
| float32 | f4 or f | Standard single-precision floating point. Compatible with C float |
| float64, float128 | f8 or d | Standard double-precision floating point. Compatible with C double and Python float object |
